Claim 1; Page 1942; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

Couble-stranded DNA) which comprises one of the 7837 "GS" sequences

given in T19001-T26837 and which is able to hybridise to part of

human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

Sequences were obtained from 3'-directed cDNA libraries prepared

from various human tissues; synthesis of cDNA was initiated from the

circum various human tissues; synthesis of cDNA was initiated from the

circum various human tissues; synthesis of cDNA was initiated from the

circum various human tissues; synthesis of constructed sequence is unique to a particular mRNA species, almost

all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

circum standard constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

determined (sep. using primers and probes derived from the GS

sequences) as a means of diagnosing abnormal cell function or for

recognising different cell types.

Sequence 84 BP; 33 A; 17 C; 15 G; 19 T;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUMMARIES

//note="Vector: DAMP10; Site_1: Not1; Site_2: ECORI; 1st strand CDNA was primed with oligo(dTp17 on 50 ng of DNA was primed with oligo(dTp17 on 50 ng of DNA was primed with oligo(dTp17 on 50 ng of DNA was primed cellular RNA obtained from 5,000-10,000 microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the CDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Knizman. I others

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_CCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento shares and M. Fatima Honaldo.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT/T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo. "

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

Patent No. 594888
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: de la Monte, Suzanne
TITLE OF INVENTION: of Alzheimer's Disease
TITLE OF INVENTION: of Alzheimer's Disease
TORRESPONDENCE: 121
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue, Suite 600
CITY: Washington
STATE: D.C.
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121

See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

Williamson, R. and Humphries, S.
Unequal crossing-over between two alu-repetitive DNA sequences in the low-density-lipoprotein-receptor gene. A possible mechanism for the defect in a patient with familial hypercholesterolaemia
Bur. J. Biochem. 164 (1), 77-81 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      *Source: hypercholesterol aemia
See X0520 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                              A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-726837 and which is able to hybridise to part of human gromatc DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-c untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed as as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequence) as means of diagnosing abnormal cell function or for crecognising different cell types. 25 G; 25 T;

Testing polymorphic forms for use in e.g. forensics, paternity determining polymorphic typing for disease

Esting or phenotypic typing for disease

Claim 1: Page 219; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in CX 030121-X10268 and the been isolated using the primers represented in the appropriate IUPAC-IUB ambiguity code. These fragments can be used in the appropriate IUPAC-IUB ambiguity code. These fragments can be used in the appropriate IUPAC-IUB ambiguity code. These fragments can be used in the appropriate IUPAC-IUB ambiguity code. These fragments for use in the complex for determining polymorphic forms in an individual for use in the appropriate IUPAC-IUB ambiguity sesting or for phenotypic typing for diseases complexed as agammaglobulinemia, diabetes inspiduous, lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familiah hypercholesterolemia, polycystic kidney disease, thereforest, hereditary compensation of the partors and complexed autoimmune diseases, inflammation, cancer, diseases of the nervous such autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longerity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular
                                                                                                                                                             Care A single-stranded DNA) with comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is calemed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-ond of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 103 BP; 22 A; 27 C; 21 G; 31 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9894 CATGGTGAAACCCTGTCTCTACTAAAAATACAAAAATTAGCCGGGCATGGTGGTGCACGC 9953

determining portynologic forms for use in e.g. Forensics, paternity

testing or phenotypic typing for disease

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

markers which have been isolated using the primers represented in

X09121-X10268. The base occupying the polymorphic site is indicated by

the appropriate IUPAC-IUB ambiguity code. These fragments can be used in

methods for determining polymorphic forms in an individual for use in

e.g. forensics, paternity testing or for phenotypic typing for diseases

such as agammaglobulinmenta, diabetes insiphidus, Lesch. Nyhan syndrome,

muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial

spherocytosis, on Willebrand's disease, tuberculs sclerosis, hereditary

contoner, osteogenesis imperfects, acute intermittent porphyria,

autoimmune diseases, inflammation, cancer, diseases of the nervous

system, infection by pathogenic miscroorganisms, and characteristics such

as longevity, appearance (e.g. baldness, obesity), strength, speed,

endurance, fertility, and susceptibility or receptivity to particular

drugs or therapeutic treatments. The isolated polymorphic nucleic acid

system, since the streatments. The isolated polymorphic or

Tain 1. Page 218; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic x10269-X12937 are human DNA fragments which contain biallelic polymorphic x10269-X12937 are human DNA fragments which contain biallelic polymorphic of markers which have been isolated using the primers represented in CC x09121-X10268 The base occupying the polymorphic stre is indicated by cc the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in CC e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, cc e.g. forensics, paternity diseases, hereditary spherocytosis, von Willebrand's disease, hereditary companies, osteogenesis in morefected, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such conting the propertity appearance (e.g. baldness, obesity), strength, speed, condurance, fertility, and susceptibility or receptivity to particular conting also be used to produce medicaments for the treatment or prophylasis.

Claim 1; Page 2029; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

Gouble-stranded DNA, which comprises one of the 7837 "GS" sequences

Gouble-stranded DNA, which comprises one of the 7837 "GS" sequences

Gouple-stranded DNA, which comprises one of the 787 "GS" sequences

C given in T19001-T28837 and which is able to hybridise to part of

Numan genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature)

Sequences were obtained from 3'-directed CDNA libraries prepared

C from various human tissues; synthesis of CDNA was initiated from the

3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-

untranslated sequence is unique to a particular mRNAs in almost

is constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

determined (esp. using primers and probes derived from the GS.

Sequences) as a means of diagnosing abnormal cell function or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15775 TTTTTTTTTTTTTGAGACAGAGTCTCACTCTATCACCCAGGCTGGAGTGCAGTGGCACAA 15834
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6312 ATCGCTTGAACCTGGGAGGCGGAGATTGCAGTGAGCCGAGATCGCACCACCACGCACTCCAG 6371
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNNA hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13-NOV-1996 (first entry)

Human gene signature HUMGSOB452.

Homen gene signature, messenger RNA; mRNA; relative abundance; frequency fundan; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 95-206931/27.

Identifying gene signatures in 3'-directed human cDNA library -
for diagnosis of abnormal cell function, by preparing cDNA that
reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                              A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA) which comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences of jiven in 719001-726837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-entranslated sequence is unique to a particular mRNAs instance of its constructed so as to reflect accurately the relative abundance of different mRNAs in the particular issue from which it, was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 18 A; 23 G; 28 T;

A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer, since the 3'-end of mRNA in the particular mRNAs mass decises, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 103 BP; 22 A; 27 C; 21 G; 31 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21785 ATTCTCCTGCCTCAGCCTCCCAAGCAGCTGGGATTACAGGTACCTGCCACCATGCCTGGT 21844

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences diven in 19001-126837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

                                                                                                                                                                                                                                                                                           is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 23 G; 23 G; 28 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-NOV-1996 (first entry)
Human gene signature HUMGS09078.
Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; eall typing; abnormal cell function; ss.
is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for

```
A single-stranded DNA for its complementary strand or the corresp.

C double-stranded DNA, which comprises one of the 7837 "62" sequences gloven in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) c sequences were obtained from 3'-directed CDNA ibraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(") as the sole primer. Since the 3'-end of mRNA by using poly(") as the sole primer. Since the 3'-end of mRNA by using poly(") as the sole primer since the 3'-end of mRNA by using poly(") as the sole primer since the 3'-end of mRNA in the particular mRNA specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS csequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Sequence 108 BP; 34 A; 31 C; 26 G; 15 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      15769 TTTTTTTTTTTTTTTTTTTTGAGACAGAGTCTCACTCTATCACCCAGGCTGGAGTGCAGTG 15828

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which is one of the 7837 "63" sequences double-stranded DNA) which comprises one of the 7837 "63" sequences of given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular mish shows the sole primers and probes derived from the GS determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 34 A; 25 G; 15 T;
Matsubara K, Okubo K;
WPI: 95-206931/27.
Identifylng gene signatures in 3'-directed human cDNA library - e.g.
for diagnosis of abnormal cell function, by preparing cDNA that
reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                          tissues

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUMMARIES
